

Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of Claims:

1-18. (Cancelled)

19. (Currently amended) A toothbrush comprising:
a brush head having first and second ends and peripheral edge regions extending therebetween;
bristle clusters protruding from a cleaning surface of the brush head; ~~and~~
a depression disposed in the surface and surrounding a respective at least one of the bristle cluster, the depression having a bottom into which the bristle cluster penetrates and in which the bristle cluster is fixed, the depression defined by a pair of longer side walls and a shorter end wall and wherein the shorter end wall is disposed inward on the surface of the head from the peripheral edge and the end of the depression opposite the shorter end wall is open and extends fully to the peripheral edge of the head; and
wherein the bristle clusters include at least one bristle cluster not surrounded by a depression.

20. (Previously Presented) The toothbrush according to claim 19, wherein the depression is adapted to substantially correspond to a cross section of the bristle cluster.

21. (Previously Presented) The toothbrush according to claim 20, wherein the depression and the cross section of the bristle cluster are substantially rectangular, the depression defining a pair of side walls of major and minor extent.

22. (Previously Presented) The toothbrush according to claim 21, further comprising a handle connected to the first end of the brush head, the handle and brush head defining a longitudinal axis, wherein the side walls have a major extent disposed transversely to the longitudinal axis.

23. (Previously Presented) The toothbrush according to claim 22, wherein the depressions extend along the peripheral edge regions.

24. (Previously Presented) The toothbrush according to claim 23, wherein the depressions are tapered off toward an outer edge of the brush head.

25. (Previously Presented) The toothbrush according to claim 23, wherein the bristle cluster not surrounded by a depression is disposed between adjacent depressions having bristle clusters protruding therefrom.

26. (Previously Presented) The toothbrush according to claim 25, further comprising a bristle cluster having a substantially rectangular cross section, the longer extent are disposed transverse to the longitudinal axis.

27. (Previously Presented) The toothbrush according to claim 25, wherein the depressions with the bristle clusters protruding therefrom are arranged along the peripheral edge regions.

28. (Previously Presented) The toothbrush according to claim 27, further comprising four depressions each having one bristle cluster protruding therefrom arranged along the peripheral edge regions.

29. (Previously Presented) The toothbrush according to claim 27, wherein the bristle clusters protruding from the depressions have a greater length than an adjacent bristle cluster.

30. (Previously Presented) The toothbrush according to claim 27, wherein the brush head comprises a slot extending along the longitudinal axis and dividing the brush head into two halves.

31. (Previously Presented) The toothbrush according to claim 21, wherein the brush head comprises a round brush head configured for oscillating rotational movement.

32. (Previously Presented) The toothbrush according to claim 31, further comprising a plurality of depressions extending a short distance from an outer edge of the brush head.

33. (Previously Presented) The toothbrush according to claim 32, wherein the depressions tapered off outwardly along a radial direction.

34. (Previously Presented) The toothbrush according to claim 33, wherein the bristle cluster not surrounded by a depression protrudes between two adjacent depressions with bristle clusters protruding therefrom.

35. (Previously Presented) The toothbrush according to claim 34, wherein at least one bristle cluster has a rectangular cross section and define a pair of side walls of major and minor extent, the walls of major extent disposed in a circumferential direction of the brush head and at the same distance from the edge.

36. (Previously Presented) The toothbrush according to claim 31, wherein the bristle clusters protruding from the depressions have a greater length than those of the adjacent bristle clusters.
